Variables

User Input

std::cin , which stands for "character input", reads user input from the keyboard.

Here, the user can enter a number, press enter , and that number will get stored in tip .

Variables

A variable refers to a storage location in the computer's memory that one can set aside to save, retrieve, and manipulate data.

Arithmetic Operators

C++ supports different types of arithmetic operators that can perform common mathematical operations:

- + addition
- subtraction
- * multiplication
- / division
- % modulo (yields the remainder)

```
int tip = 0;
std::cout << "Enter amount: ";</pre>
std::cin >> tip;
// Declare a variable
int score;
// Initialize a variable
score = 0;
int x = 0;
x = 4 + 2; // x is now 6
x = 4 - 2; // x is now 2
x = 4 * 2; // x is now 8
```

x = 4 / 2; // x is now 2x = 4 % 2; // x is now 0

int is a type for storing integer (whole) numbers. An integer typically requires 4 bytes of memory space and ranges from -2^{31} to 2^{31} -1.

```
int year = 1991;
int age = 28;
```

double Type

double is a type for storing floating point (decimal) numbers. Double variables typically require 8 bytes of memory space.

```
double price = 8.99;
double pi = 3.14159;
```

Chaining the Output

std::cout can output multiple values by chaining them using the output operator << .

Here, the output would be I'm 28.

```
int age = 28;
std::cout << "I'm " << age << ".\n";
```

char Type

char is a type for storing individual characters. Characters are wrapped in single quotes '. Characters typically require 1 byte of memory space and range from -128 to 127.

```
char grade = 'A';
char punctuation = '?';
```

string Type

std::string is a type for storing text strings. Strings are wrapped in double quotes ".

```
std::string message = "good nite";
std::string user = "codey";
```

bool Type

bool is a type for storing true or false boolean values. Booleans typically require 1 byte of memory space.

```
bool organ donor = true;
bool late to work = false;
```
