code cademy

Hello World

New Line

The escape sequence \n (backward slash and the letter n) generates a new line in a text string.

Program Structure

The program runs line by line, from top to bottom:

- The first line instructs the compiler to locate the file that contains a library called iostream. This library contains code that allows for input and output.
- The main() function houses all the instructions for the program.

```
std::cout << "Hello\n";
std::cout << "Hello again\n";</pre>
```

```
int main() {
   std::cout << "1\n";
   std::cout << "2\n";
   std::cout << "3\n";
}</pre>
```

#include <iostream>

Basic Output

std::cout is the "character output stream" and it is used to write to the standard output. It is followed by the symbols << and the value to be displayed.

```
std::cout << "Hello World!\n";</pre>
```

Compile Command

Using GNU, the compilation command is $\,g++\,$ followed by the file name. Here, the name of the source file is **hello.cpp**.

```
g++ hello.cpp
```

Execute Command

codecademy

The execution command is ./ followed by the file name. Here, the name of the executable file is a.out.

./a.out

Single-line Comments

Single-line comments are created using two consecutive forward slashes. The compiler ignores any text after // on the same line.

// This line will denote a comment in C++

Multi-line Comments

Multi-line comments are created using /* to begin the comment, and */ to end the comment. The compiler ignores any text in between.

/* This is all commented out. None of it is going to run! * /
